**INDICATIONS AND CLINICAL USE**

METOJECT SUBCUTANEOUS (methotrexate injection) is indicated as a Disease Modifying Antirheumatic Drug (DMARD) in the following diseases where standard therapeutic interventions fail:
- Severe disabling psoriasis/psoriatic arthritis
- Severe disabling rheumatoid arthritis (RA)

In the treatment of psoriasis, METOJECT SUBCUTANEOUS should be restricted to severe recalcitrant, disabling psoriasis, which is not adequately responsive to other forms of therapy, but only when the diagnosis has been established after dermatologic consultation.

**Geriatrics:**
The clinical pharmacology of methotrexate has not been well studied in older individuals. Due to diminished hepatic and renal function, as well as decreased folate stores in this population, relatively low doses should be considered, and these patients should be closely monitored for early signs of toxicity.

**Pediatrics:**
Safety and effectiveness in pediatric patients have not been established.

**Limitation of Use**
METOJECT SUBCUTANEOUS is not indicated for the treatment of neoplastic diseases.
CONTRAINDICATIONS
METOJECT SUBCUTANEOUS (methotrexate injection) is Contraindicated in:

- Patients who are hypersensitive to this drug or to any ingredient in the formulation or component of the container. For a complete listing, see the DOSAGE FORMS, COMPOSITION AND PACKAGING section.
- In patients with severe renal impairment including end stage renal disease with and without dialysis (see WARNINGS AND PRECAUTIONS- Renal, Special populations and DOSAGE AND ADMINISTRATION- Special populations).
- Pregnancy: Methotrexate can cause fetal death, embryotoxicity, abortion or teratogenic effects when administered to a pregnant woman.
- Women of childbearing potential should not be started on methotrexate until pregnancy is excluded and should be fully counselled on the serious risk to the fetus should they become pregnant while undergoing treatment. Pregnancy should be avoided if either partner is receiving methotrexate. (see WARNINGS AND PRECAUTIONS).
- Nursing mothers: Due to the potential for serious adverse reactions in breast fed infants.
- Patients with alcoholism, alcoholic liver disease or other chronic liver disease.
- Patients with overt or laboratory evidence of immunodeficiency syndromes.
- Patients with pre-existing blood dyscrasias, such as bone marrow hypoplasia, leucopenia, thrombocytopenia or significant anemia.
- With nitrous oxide anesthesia (see WARNINGS AND PRECAUTIONS: Renal and DRUG INTERACTIONS- Drug-Drug Interactions).

WARNINGS AND PRECAUTIONS

<table>
<thead>
<tr>
<th>Serious Warnings and Precautions</th>
</tr>
</thead>
<tbody>
<tr>
<td>METOJECT SUBCUTANEOUS (methotrexate injection) should be used only by physicians whose knowledge and experience includes the use of immunosuppressant therapy because of the possibility of serious toxic reactions (see WARNINGS AND PRECAUTIONS: General).</td>
</tr>
<tr>
<td>Methotrexate has been reported to cause fetal death and/or congenital anomalies (see Special Populations: Pregnant Women section below). Therefore, use is contraindicated for women of childbearing potential until pregnancy is excluded and pregnant patients (see CONTRAINDICATIONS).</td>
</tr>
</tbody>
</table>

General
Fatal toxicities related to inadvertent daily rather than weekly dosing have been reported. It should be emphasized to the patient that the recommended dose is taken weekly.

Because of the possibility of serious toxic reactions (which can be fatal), METOJECT SUBCUTANEOUS should be used only in patients with psoriasis or rheumatoid arthritis with severe, recalcitrant, disabling disease that is not adequately responsive to other forms of therapy.
Deaths have been reported with the use of Methotrexate in the treatment of psoriasis and rheumatoid arthritis. Because of the possibility of serious toxic reactions the patient should be informed by the physician of the risks involved and should be under a physician’s constant supervision.

METOJECT SUBCUTANEOUS has the potential for serious toxicity. Toxic effects may be related in frequency and severity to dose or frequency of administration but have been seen at all doses. Because they can occur at any time during therapy, it is necessary to follow patients on METOJECT SUBCUTANEOUS closely. Most adverse reactions are reversible if detected early. When such reactions do occur, the drug should be reduced in dosage or discontinued and appropriate corrective measures should be taken. If necessary, this could include the use of leucovorin calcium and/or acute, intermittent hemodialysis with a high-flux dialyzer (see Overdosage). If METOJECT SUBCUTANEOUS therapy is re-instituted, it should be carried out with caution, with adequate consideration of further need for the drug and with increased alertness as to possible recurrence of toxicity.

Methotrexate exits slowly from third space compartments (e.g., pleural effusions or ascites). This results in a prolonged terminal plasma half-life and unexpected toxicity. In patients with significant third space accumulations, it is advisable to evacuate the fluid before treatment and to monitor plasma methotrexate levels.

METOJECT SUBCUTANEOUS should be used with extreme caution in the presence of debility.

**Carcinogenesis and Mutagenesis**
No controlled human data exist regarding the risk of neoplasia with methotrexate. Methotrexate has been evaluated in a number of animal studies for carcinogenic potential with inconclusive results. Although there is evidence that methotrexate causes chromosomal damage to animal somatic cells and human bone marrow cells, the clinical significance remains uncertain. Assessment of the carcinogenic potential of methotrexate is complicated by conflicting evidence of an increased risk of certain tumors in rheumatoid arthritis. Benefit should be weighed against this potential risk before using methotrexate alone or in combination with other drugs, especially in children or young adults.

Also, see **TOXICOLOGY**.

**Gastrointestinal**
If vomiting, diarrhea, or stomatitis occurs, resulting in dehydration, METOJECT SUBCUTANEOUS should be discontinued until recovery occurs. Diarrhea and ulcerative stomatitis require interruption of therapy; otherwise, hemorrhagic enteritis and death from intestinal perforation may occur. METOJECT SUBCUTANEOUS should be used with extreme caution in the presence of peptic ulcer disease or ulcerative colitis.

Unexpectedly severe (sometimes fatal) gastrointestinal toxicity have been reported with concomitant administration of METOJECT SUBCUTANEOUS (usually in high dosage) along with some non-steroidal anti-inflammatory drugs (NSAIDs) (see DRUG INTERACTIONS).
Drug Interactions with Proton Pump Inhibitors (PPI): Use caution when administering high-dose methotrexate to patients receiving proton pump inhibitor (PPI) therapy as concomitant use of some PPIs, such as omeprazole, esomeprazole, and pantoprazole, with methotrexate (primarily at high dose), may elevate and prolong serum levels of methotrexate and/or its metabolite hydromethotrexate, possibly leading to methotrexate toxicities (see DRUG INTERACTIONS: Drug-Drug Interactions).

Hematologic
METOJECT SUBCUTANEOUS should be used with caution in patients with impaired bone marrow function and previous or concomitant wide field radiotherapy. METOJECT SUBCUTANEOUS may produce marked bone marrow depression with resultant anemia, aplastic anemia, pancytopenia, leucopenia neutropenia and/or thrombocytopenia. In patients with malignancy and pre-existing hematopoietic impairment, the drug should be used with caution, if at all. In controlled clinical trials in rheumatoid arthritis (n=128), leucopenia (WBC <3000/mm^3) was seen in 2 patients, thrombocytopenia (platelets <1,000,000/mm^3) in 6 patients, and pancytopenia in 2 patients.

In psoriasis and rheumatoid arthritis, METOJECT SUBCUTANEOUS should be stopped immediately if there is a significant drop in blood counts. Patients with profound granulocytopenia and fever should be evaluated immediately and usually require parenteral broad-spectrum antibiotic therapy.

Unexpectedly severe (sometimes fatal) bone marrow suppression and aplastic anemia have been reported with concomitant administration of METOJECT SUBCUTANEOUS (usually in high dosage) along with some non-steroidal anti-inflammatory drugs (NSAIDs) (see DRUG INTERACTIONS).

Hepatic/Biliary/Pancreatic
METOJECT SUBCUTANEOUS has the potential for acute and chronic hepatotoxicity. Acutely, liver enzyme elevations are frequently seen after METOJECT SUBCUTANEOUS administration and are usually not a reason for modification of METOJECT SUBCUTANEOUS therapy. Liver enzyme elevations are usually transient and asymptomatic, and also do not appear predictive of subsequent hepatic disease. Persistent liver abnormalities, and/or decrease of serum albumin may be indicators of serious liver toxicity. Chronic toxicity is potentially fatal; it generally has occurred after prolonged use (generally two years or more) and after a total cumulative dose of at least 1.5 grams. Liver biopsy after sustained use often shows histologic changes, and fibrosis and cirrhosis have been reported; these latter lesions may not be preceded by symptoms or abnormal liver function tests in the psoriasis population. Periodic liver biopsies are usually recommended for psoriatic patients who are under long-term treatment. Persistent abnormalities in liver function tests may precede appearance of fibrosis or cirrhosis in the rheumatoid arthritis population. In studies in psoriatic patients, hepatotoxicity appeared to be a function of total cumulative dose and appeared to be enhanced by alcoholism, obesity, diabetes and advanced age. An accurate incidence rate has not been determined; the rate of progression and reversibility of lesions is not known. Special caution is indicated in the presence of pre-existing liver damage or impaired hepatic function.
Methotrexate has caused reactivation or worsening of hepatitis B and C infections, in some cases resulting in death. Some cases of hepatitis B reactivation have occurred after discontinuation of methotrexate. Prior to treatment with methotrexate, clinical and laboratory evaluation should be performed to evaluate preexisting hepatitis virus B and hepatitis virus C infection. Methotrexate is not recommended for patients with active or chronic hepatitis B or C infection.

In psoriasis, liver damage and function tests, including serum albumin and prothrombin time, should be performed several times prior to dosing, but are often normal in the face of developing fibrosis or cirrhosis. These lesions may be detectable only by biopsy.

The usual recommendation is to obtain a liver biopsy: 1) before the start of therapy or shortly after initiation of therapy (4-8 weeks); 2) after a total cumulative dose of 1.5 grams; and 3) after each additional 1.0 to 1.5 grams. Moderate fibrosis or any cirrhosis normally leads to discontinuation of the drug; mild fibrosis normally suggests a repeat biopsy in 6 months. Milder histologic findings such as fatty change and low grade portal inflammation are relatively common pre-therapy. Although these mild changes are usually not a reason to avoid or discontinue methotrexate therapy, the drug should be used with caution.

Clinical experience with liver disease in rheumatoid arthritis is limited, but the same risk factors would be anticipated. Liver function tests are also usually not reliable predictors of histological changes in this population.

In rheumatoid arthritis, advanced age at first use of methotrexate and increasing duration of therapy have been reported as risk factors for hepatotoxicity. Persistent abnormalities in liver function tests may precede appearance of fibrosis or cirrhosis in the rheumatoid population. Liver function tests should be performed at baseline and at 4-8 week intervals in patients receiving methotrexate for rheumatoid arthritis. Pretreatment liver biopsy should be performed for patients with a history of excessive alcohol consumption, persistently abnormal baseline liver function test values, or chronic hepatitis B or C infection. During therapy, liver biopsy should be performed if there are persistent liver function test abnormalities, or there is a decrease in serum albumin below the normal range (in the setting of well controlled rheumatoid arthritis).

If the results of a liver biopsy show mild changes (Roenigk grades I, II, IIIa), METOJECT SUBCUTANEOUS may be continued and the patient monitored according to the recommendations listed above. METOJECT SUBCUTANEOUS should be discontinued in any patient who displays persistently abnormal liver function tests and refuses liver biopsy, or in any patient whose liver biopsy shows moderate to severe changes (Roenigk grade IIIb or IV).

There is a combined reported experience in 217 rheumatoid arthritis patients with liver biopsies both before and during treatment (after a cumulative dose of at least 1500 mg) and in 714 patients with a biopsy only during treatment. There are 64 (7%) cases of fibrosis and 1 (0.1%) case of cirrhosis. Of the 64 cases of fibrosis, 60 were deemed mild. The reticulin stain is more sensitive for early fibrosis and its use may increase these figures. It is unknown whether even longer use will increase these risks.
**Immune**

METOJECT SUBCUTANEOUS should be used with extreme caution in the presence of active infection, and is usually contraindicated in patients with overt or laboratory evidence of immunodeficiency syndromes.

Immunization may be ineffective when given during methotrexate therapy. Immunization with live virus vaccines is generally not recommended. There have been reports of disseminated vaccinia infections after smallpox immunization in patients receiving methotrexate therapy. Hypogammaglobulinemia has been reported rarely.

**Neurologic**

A transient acute neurologic syndrome has been observed in patients treated with high dosage regimens. Manifestations of this neurologic disorder may include behavioural abnormalities, focal sensorimotor signs, including transient blindness and abnormal reflexes. The exact cause is unknown.

Cases of severe neurological adverse reactions that ranged from headache to paralysis, coma and stroke-like episodes have been reported mostly in juveniles and adolescents given methotrexate in combination with cytarabine.

**Renal**

Methotrexate is contraindicated in patients with severe renal impairment including end stage renal disease with and without dialysis (see CONTRAINDICATIONS and DOSAGE AND ADMINISTRATION—Special populations). Methotrexate therapy in patients with mild and moderate renal impairment should be undertaken with extreme caution, and at reduced dosages, because renal dysfunction will prolong methotrexate elimination. Methotrexate may cause renal damage that may lead to acute renal failure. Nephrotoxicity is due primarily to the precipitation of methotrexate and 7-hydroxymethotrexate in the renal tubules. Close attention to renal function including adequate hydration, urine alkalinization and measurement of serum methotrexate and creatinine levels are essential for safe administration.

Nephritis has been reported on co-administration with nitrous oxide anesthesia in rheumatoid arthritis patients (see CONTRAINDICATIONS and DRUG INTERACTIONS: Drug-Drug Interactions).

**Respiratory**

Methotrexate-induced lung disease, including acute or chronic interstitial pneumonitis is a potentially dangerous lesion, which may occur at any time during therapy and which has been reported at low doses. It is not always fully reversible and fatalities have been reported. Pulmonary symptoms (especially a dry non-productive cough) or a non-specific pneumonitis occurring during methotrexate therapy may be indicative of a potentially dangerous lesion and require interruption of treatment and careful investigation. Although clinically variable, the typical patient with methotrexate-induced lung disease presents with fever, cough, dyspnea, hypoxemia, and an infiltrate on chest X-ray; infection (including pneumonia) needs to be excluded. This lesion can occur at all dosages.
Pulmonary alveolar haemorrhage has been reported with methotrexate. This event may also be associated with vasculitis and other comorbidities. Prompt investigations should be considered when pulmonary alveolar haemorrhage is suspected to confirm the diagnosis.

Pneumonia (in some cases leading to respiratory failure) may occur. Potentially fatal opportunistic infections, especially *Pneumocystis carinii* pneumonia, may occur with METOJECT SUBCUTANEOUS therapy. When a patient presents with pulmonary symptoms, the possibility of Pneumocystis carinii should be considered.

**Sexual Health**

*Fertility:* Methotrexate has been reported to cause impairment of fertility, oligospermia, menstrual dysfunction and amenorrhea in humans, during and for a short period after cessation of therapy.

*Reproduction:* Methotrexate causes embryotoxicity, abortion, and fetal defects in humans. Therefore, the possible risks of effects on reproduction, pregnancy loss and congenital malformations should be discussed with both male and female patients of childbearing potential. The absence of pregnancy must be confirmed before METOJECT SUBCUTANEOUS is used. If women of a sexually mature age are treated, effective contraception must be performed during treatment and from at least six months to one year (see WARNINGS AND PRECAUTIONS - Special Populations – Contraception in females).

Methotrexate is contraindicated during pregnancy in non-oncological indications. If pregnancy occurs during treatment with methotrexate and from six months to one year after, medical advice should be given regarding the risk of harmful effects on the child associated with treatment and ultrasonography examinations should be performed to confirm normal fetal development. In animal studies, methotrexate has shown reproductive toxicity, especially during the first trimester. Methotrexate has been shown to be teratogenic to humans; it has been reported to cause fetal death, miscarriages and/or congenital abnormalities (e.g. craniofacial, cardiovascular, central nervous system and extremity-related). Methotrexate is a powerful human teratogen, with an increased risk of spontaneous abortions, intrauterine growth restriction and congenital malformations in case of exposure during pregnancy. The risk of effects on reproduction should be discussed with both male and female patients taking METOJECT SUBCUTANEOUS.

**Skin**

Severe, occasionally fatal, dermatologic reactions, including toxic epidermal necrolysis (Lyell’s Syndrome), Stevens-Johnson syndrome, exfoliative dermatitis, skin necrosis and erythema multiforme have been reported in children and adults within days of oral methotrexate administration. Reactions were noted after single or multiple, low, intermediate or high doses of methotrexate in patients with rheumatoid arthritis or psoriasis. Recovery has been reported with discontinuation of therapy.
Lesions of psoriasis may be aggravated by concomitant exposure to ultraviolet radiation. Radiation dermatitis and sunburn may be "recalled" by the use of methotrexate.

**Special Populations**

**Pregnant Women:**
METOJECT SUBCUTANEOUS is contraindicated in pregnant patients (see **CONTRAINDICATIONS** and **WARNINGS AND PRECAUTIONS**). METOJECT SUBCUTANEOUS can cause fetal death, embryotoxicity, abortion, or teratogenic effects when administered to a pregnant woman. The risk of effects on reproduction should be discussed with both male and female patients taking METOJECT SUBCUTANEOUS.

Women of childbearing potential should not be started on METOJECT SUBCUTANEOUS until pregnancy is excluded and should be fully counselled on the serious risk to the fetus should they become pregnant while undergoing treatment. Effective contraception must be used during treatment with methotrexate and at least from 6 months to one year after. During treatment pregnancy tests should be repeated as clinically required (e.g. after any gap of contraception). Female patients of reproductive potential must be counselled regarding pregnancy prevention and planning. Pregnancy should be avoided if either partner is receiving METOJECT SUBCUTANEOUS.

It is not known if methotrexate is present in semen. Methotrexate has been shown to be genotoxic in animal studies, such that the risk of genotoxic effects on sperm cells cannot completely be excluded. There are insufficient data to estimate the risks of malformations or miscarriage following paternal exposure. As precautionary measures, sexually active male patients or their female partners are recommended to use reliable contraception during treatment of the male patient and from 6 months to one year after cessation of methotrexate. Men should not donate semen during therapy or from 6 months to one year following discontinuation of methotrexate.

**Nursing Women:**
Because of the potential for serious adverse reactions from methotrexate in breast fed infants, METOJECT SUBCUTANEOUS is contraindicated in nursing mothers.

**Pediatrics:**
Safety and effectiveness in pediatric patients have not been established.

**Geriatrics:** The clinical pharmacology of methotrexate has not been well studied in older individuals. Due to diminished hepatic and renal function, as well as decreased folate stores in this population, relatively low doses should be considered, and these patients should be closely monitored for early signs of toxicity.

**Renal Impairment:** METOJECT SUBCUTANEOUS is contraindicated in patients with severe renal impairment (see **CONTRAINDICATIONS** and **DOSAGE AND ADMINISTRATION**-Special populations).
Monitoring and Laboratory Tests

General:
Patients undergoing methotrexate therapy should be closely monitored so that toxic effects are detected promptly. Baseline assessment should include a complete blood count (CBC) with differential and platelet counts, hepatic enzymes, renal function tests, and a chest X-ray. During therapy of rheumatoid arthritis and psoriasis, monitoring of these parameters is recommended: hematology at least monthly, and hepatic enzyme levels and renal function every 1 to 2 months.

During initial or changing doses, or during periods of increased risk of elevated methotrexate blood levels (e.g., dehydration), more frequent monitoring may also be indicated.

Liver:
Liver biopsies prior to METOJECT SUBCUTANEOUS therapy are not indicated routinely. Liver function tests (LFTs) should be determined prior to the initiation of therapy with METOJECT SUBCUTANEOUS and they should be monitored regularly throughout therapy. A relationship between abnormal liver function tests and fibrosis or cirrhosis of the liver has not been established. Transient liver function test abnormalities are observed frequently after METOJECT SUBCUTANEOUS administration and are usually not cause for modification of methotrexate therapy. Persistent liver function test abnormalities just prior to dosing and/or depression of serum albumin may be indicators of serious liver toxicity and require evaluation.

Respiratory:
Pulmonary function tests may be useful if methotrexate-induced lung disease is suspected, especially if baseline measurements are available.

Serum Level Monitoring:
Serum methotrexate level monitoring can significantly reduce methotrexate toxicity and mortality.

Patients subject to the following conditions are predisposed to developing elevated or prolonged methotrexate levels and benefit from routine monitoring of levels: eg, pleural effusion, ascites, gastrointestinal tract obstruction, previous cisplatin therapy, dehydration, aciduria, impaired renal function.

Some patients may have delayed methotrexate clearance in the absence of these features. It is important that patients be identified within 48 hours since methotrexate toxicity may not be reversible if adequate leucovorin rescue is delayed for more than 42 to 48 hours.

Monitoring of methotrexate concentrations should include determination of a methotrexate level at 24, 48, or 72 hours, and assessment of the rate of decline in methotrexate concentrations (to determine how long to continue leucovorin rescue).

ADVERSE REACTIONS

Adverse Drug Reaction Overview
In general, the incidence and severity of acute side effects are related to dose, frequency of administration, and the duration of the exposure to significant blood levels of methotrexate to the target organs. The most serious reactions are discussed in WARNINGS AND PRECAUTIONS. That section should also be consulted when looking for information about adverse reactions with methotrexate.

The most frequently reported adverse reactions include ulcerative stomatitis, leucopenia, nausea, and abdominal distress. Other frequently reported adverse effects are malaise, undue fatigue, chills and fever, dizziness and decreased resistance to infection.

**Adverse Drug Reactions by Organ System**

**Blood and lymphatic system disorders**
Leukopenia, anaemia, thrombopenia, pancytopenia, agranulocytosis and severe courses of bone marrow depression, lymphoproliferative disorders.

**Cardiac disorders**
Pericarditis, pericardial effusion and pericardial tamponade.

**Eye disorders**
Visual disturbances and retinopathy.

**Gastrointestinal disorders**
Stomatitis, dyspepsia, nausea, loss of appetite, oral ulcers, diarrhoea, pharyngitis, enteritis, vomiting, gastrointestinal ulcers, haematemeses, haemorrhage and toxic megacolon.

**General disorders and administration site conditions**
Allergic reactions, anaphylactic shock, allergic vasculitis, fever, conjunctivitis, infection, sepsis, wound-healing impairment, hypogammaglobulinaemia and local damage (formation of sterile abscess, lipodystrophy) of injection site following intramuscular or subcutaneous administration.

**Hepatobiliary disorders**
Elevated transaminases, cirrhosis, fibrosis and fatty degeneration of the liver, decrease in serum albumin, acute hepatitis and hepatic failure.

**Metabolism and nutrition disorders**
Precipitation of diabetes mellitus.

**Musculoskeletal and connective tissue disorders**
Arthralgia, myalgia and osteoporosis, osteonecrosis of jaw (secondary to lymphoproliferative disorders).

**Neoplasms benign, malignant and unspecified (including cysts and polyps)**
Lymphoma/Lymphoproliferative disorders: there have been reports of individual cases of lymphoma and other lymphoproliferative disorders which subsided in a number of cases once treatment with methotrexate had been discontinued.
Nervous system disorders
Headache, tiredness, drowsiness, dizziness, confusion, depression, impaired vision, pain, muscular asthenia or paraesthesia in the extremities, changes in sense of taste (metallic taste), convulsions, meningism, paralysis and leukoencephalopathy.

Renal and urinary disorders
Renal failure, severe nephropathy or renal failure, azotemia, dysuria, cystitis, hematuria, urogenital dysfunction. Proteinuria has also been observed.

Reproductive system and breast disorders
Inflammation and ulceration of the vagina, loss of libido, impotence, gynaecomastia, oligospermia, impaired menstruation and vaginal discharge.

Respiratory, thoracic and mediastinal disorders
Pneumonia, interstitial alveolitis/pneumonitis often associated with eosinophilia, symptoms indicating potentially severe lung injury (interstitial pneumonitis) are: dry, not productive cough, short of breath and fever, pulmonary fibrosis, Pneumocystis carinii pneumonia, shortness of breath and bronchial asthma, pleural effusion, epistaxis, and pulmonary alveolar haemorrhage.

Skin and subcutaneous tissue disorders
Exanthema, erythema, pruritus, photosensitisation, loss of hair, increase in rheumatic nodules, herpes zoster, vasculitis, herpetiform eruptions of the skin, urticarial, increased pigmentation, acne, ecchymosis, tevens-Johnson syndrome, toxic epidermal necrolysis (Lyll’s syndrome), increased pigmentary changes of the nails, acute paronychia, furunculosis and telangiectasia.

Vascular disorders
Hypotension and thromboembolic events.

Other Adverse Drug Reactions

Adverse Reactions Reported in Rheumatoid Arthritis
Incidence greater than 10%: elevated liver enzymes 15%, nausea/vomiting 10%.
Incidence 3% to 10%: stomatitis, thrombocytopenia.
Incidence 1% to 3%: rash/pruritus/dermatitis, alopecia, diarrhea, dizziness, leucopenia and pancytopenia.

Adverse Reactions in Psoriasis
The adverse reaction rates reported are very similar to those in the rheumatoid arthritis studies. Rarely, painful psoriatic plaque erosions may appear.

Abnormal Hematologic and Clinical Chemistry Findings
Abnormal hematologic and clinical chemistry findings are discussed in WARNINGS AND PRECAUTIONS – Monitoring and Laboratory Tests.
**Post-marketing Adverse Drug Reactions**

Because these reactions are reported voluntarily from a population of uncertain size, it is generally not possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

The following adverse events have also been reported during post-marketing experience with methotrexate:

DRUG INTERACTIONS

Serious Drug Interactions

The use of nitrous oxide anesthesia with methotrexate is contraindicated (see CONTRAINDICATIONS, WARNINGS AND PRECAUTIONS - Renal and DRUG INTERACTIONS - Drug-Drug Interactions).

Overview

Methotrexate competes with reduced folates for active transport across cell membranes by means of a single carrier-mediated active transport process. Impaired renal function, as well as concurrent use of drugs such as weak organic acids that undergo tubular secretion, can markedly increase methotrexate serum levels. Laboratory studies demonstrate that methotrexate may be displaced from plasma albumin by various compounds including sulfonamides, salicylates, tetracyclines, chloramphenicol and phenytoin.

Drug-Drug Interactions

The drugs listed below are based on either drug interaction case reports or studies, or potential interactions due to the expected magnitude and seriousness of the interaction (i.e., those identified as contraindicated).

Nonsteroidal Anti-inflammatory Drugs (NSAIDs)

NSAIDs should not be administered prior to or concomitantly with high doses of methotrexate. Concomitant administration of NSAIDs with high-dose methotrexate therapy has been reported to elevate and prolong serum methotrexate levels, resulting in deaths from severe hematologic (including bone marrow suppression and aplastic anemia) and gastrointestinal toxicity. These drugs have been reported to reduce the tubular secretion of methotrexate, in an animal model, and may enhance its toxicity by increasing methotrexate levels. Caution should be used when NSAIDs and salicylates are administered concomitantly with lower doses of METOJECT SUBCUTANEOUS. In treating rheumatoid arthritis with methotrexate, the possibility of increased toxicity with concomitant use of NSAIDs including salicylates has not been fully explored. Despite the potential interactions, studies of methotrexate in patients with rheumatoid arthritis have usually included concurrent use of constant dosage regimens of NSAIDs without apparent problems.

Disease Modifying Antirheumatic drugs (DMARDs)

Combined use of methotrexate with gold, penicillamine, hydroxychloroquine, or sulfasalazine has not been studied and may increase the incidence of adverse effects.

Packed Red Blood Cells

Care should be exercised whenever packed red blood cells and METOJECT SUBCUTANEOUS are given concurrently. Patients receiving 24-hr methotrexate infusion and subsequent transfusions have showed enhanced toxicity probably resulting from prolonged high serum-Methotrexate concentrations.
**Ciprofloxacin**
Renal tubular transport is diminished by ciprofloxacin; use of METOJECT SUBCUTANEOUS with this drug should be carefully monitored.

**Radiotherapy**
Methotrexate given concomitantly with radiotherapy may increase the risk of soft tissue necrosis and osteonecrosis.

**Mercaptopurine**
Methotrexate increases the plasma levels of mercaptopurine. Combination of METOJECT SUBCUTANEOUS and mercaptopurine may therefore require dose adjustment.

**Leflunomide**
Methotrexate in combination with leflunomide may increase the risk of pancytopenia.

**Drugs Highly Bound to Plasma Proteins**
Methotrexate is partially bound to serum albumin, and toxicity may be increased because of displacement by other highly bound drugs, such as sulfonylureas, aminobenzoic acid, salicylates, phenylbutazone, phenytoin, sulfonamides, some antibiotics such as penicillins, tetracycline, pristinamycin, probenecid, and chloramphenicol.

**Probenecid**
Renal tubular transport is also diminished by probenecid; use of METOJECT SUBCUTANEOUS with this drug should be carefully monitored.

**Nephrotoxic Drugs**
Although not documented, other nephrotoxic drugs such as aminoglycosides, Amphotericin B and Cyclosporin could theoretically increase METOJECT SUBCUTANEOUS toxicity by decreasing its elimination.

**Penicillins and Sulfonamides**
Penicillins and sulfonamides may reduce the renal clearance of METOJECT SUBCUTANEOUS; hematologic and gastrointestinal toxicity have been observed in combination with METOJECT SUBCUTANEOUS.

**Oral Antibiotics**
Oral antibiotics such as tetracycline, chloramphenicol, and non-absorbable broad spectrum antibiotics, may decrease intestinal absorption of METOJECT SUBCUTANEOUS or interfere with the enterohepatic circulation by inhibiting bowel flora and suppressing metabolism of the drug by bacteria. For example: Neomycin, Polymyxin B, Nystatin and Vancomycin decrease METOJECT SUBCUTANEOUS absorption, whereas Kanamycin increases METOJECT SUBCUTANEOUS absorption.
Trimethoprim/sulfamethoxazole has been reported rarely to increase bone marrow suppression in patients receiving METOJECT SUBCUTANEOUS, probably by decreased tubular secretion and/or an additive antifolate effect.

**Theophylline**
METOJECT SUBCUTANEOUS may decrease the clearance of theophylline; theophylline levels should be monitored when used concurrently with METOJECT SUBCUTANEOUS.

**Vitamins**
Vitamin preparations containing folic acid or its derivatives may decrease responses to systemically administered METOJECT SUBCUTANEOUS.

In patients with rheumatoid arthritis or psoriasis, folic acid or folinic acid may reduce methotrexate toxicities such as gastrointestinal symptoms, stomatitis, alopecia and elevated liver enzymes.

Before taking a folate supplement, it is advisable to check B₁₂ levels, particularly in adults over the age of 50, since folate administration can mask symptoms of B₁₂ deficiency.

Folate deficiency states may increase METOJECT SUBCUTANEOUS toxicity.

**Hepatoxins**
The potential for increased hepatotoxicity when METOJECT SUBCUTANEOUS is administered with other hepatotoxic agents has not been evaluated. However, hepatotoxicity has been reported in such cases. Therefore, patients receiving concomitant therapy with METOJECT SUBCUTANEOUS and other potential hepatotoxic agents (e.g., leflunomide, azathioprine, sulfasalazine, retinoids) should be closely monitored for possible increased risk of hepatotoxicity.

**Proton Pump Inhibitors (PPI)**
Use caution when administering high-dose methotrexate to patients receiving proton pump inhibitor (PPI) therapy. Concomitant use of PPIs and high-dose methotrexate should be avoided especially in patients with renal impairment. Case reports and published population pharmacokinetic studies suggest that concomitant use of some PPIs, such as omeprazole, esomeprazole, and pantoprazole, with methotrexate (primarily at high dose), may elevate and prolong serum levels of methotrexate and/or its metabolite hydromethotrexate, possibly leading to methotrexate toxicities. In two of these cases, delayed methotrexate elimination was observed when high-dose methotrexate was co-administered with PPIs, but was not observed when methotrexate was co-administered with ranitidine. However, no formal drug interaction studies of methotrexate with ranitidine have been conducted.

**Amiodarone**
Amiodarone administration to patients receiving methotrexate treatment for psoriasis has induced ulcerated skin lesions.

**Diuretics**
Bone marrow suppression and decreased folate levels have been described in the concomitant administration of triamterene and methotrexate.
Psoralen Plus Ultraviolet Light (PUVA) Therapy
Skin cancer has been reported in few patients with psoriasis receiving a concomitant treatment with methotrexate plus PUVA therapy (methoxalen and ultraviolet light).

Nitrous oxide
The use of nitrous oxide anesthesia potentiates the effect of methotrexate on folate metabolism, yielding increased toxicity such as severe, unpredictable myelosuppression, stomatitis, neurotoxicity (with intrathecal administration of methotrexate) and nephritis (see CONTRAINDICATIONS and WARNINGS AND PRECAUTIONS: Renal). In case of accidental co-administration, this effect can be reduced by the use of leucovorin rescue.

Drug-Food Interactions
The bioavailability of orally administered methotrexate is reduced by food, particularly milk products.

Drug-Lifestyle Interactions
Use of alcohol with METOJECT SUBCUTANEOUS is contraindicated (see CONTRAINDICATIONS). The effects of smoking, on the pharmacokinetics of methotrexate have not been specifically studied.

Methotrexate may cause adverse reactions such as dizziness and fatigue which can affect the ability to drive or operate machinery.

DOSAGE AND ADMINISTRATION

Dosing Considerations
METOJECT SUBCUTANEOUS should only be prescribed by physicians, who are familiar with the various characteristics of the medicinal product and its mode of action. The administration should routinely be done by health professionals. METOJECT SUBCUTANEOUS is injected once weekly.

Methotrexate elimination is reduced in patients with a third distribution space (ascites, pleural effusions). Such patients require especially careful monitoring for toxicity, and require dose reduction or, in some cases, discontinuation of methotrexate administration.

Recommended Dose and Dosage Adjustments

Psoriasis
Recommended Starting Dose Schedules
- Weekly single, SC dose schedule: 7.5 to 25 mg per week until adequate response is achieved.

The recommended initial dose is 7.5 mg of methotrexate once weekly.
Dosages in each schedule may be gradually adjusted to achieve optimal clinical response; 25 mg/week should not ordinarily be exceeded.

Once optimal clinical response has been achieved, the dosage schedule should be reduced to the lowest possible amount of drug and to the longest possible rest period. The use of METOJECT SUBCUTANEOUS may permit the return to conventional topical therapy, which should be encouraged.

**Rheumatoid Arthritis**

Recommended Starting Dosage Schedules

- Weekly single, SC dose schedule: 7.5 to 25 mg per week until adequate response is achieved.

Dosages in each schedule may be gradually adjusted to achieve optimal clinical response. The recommended initial dose is 7.5 mg of methotrexate once weekly. Depending on the individual activity of the disease and tolerability by the patient, the initial dose may be increased gradually by 2.5 mg per week. A weekly dose of 25 mg should in general not be exceeded.

Therapeutic response usually begins within 3 to 6 weeks and the patient may continue to improve for another 12 weeks or more. Upon achieving the therapeutically desired result, the dose should be reduced gradually to the lowest possible effective maintenance dose.

**Special Populations**

**Renal Impairment:** Methotrexate is excreted to a significant extent by the kidneys, thus in patients with renal impairment the health care provider may need to adjust the dose to prevent accumulation of drug. The table below provided recommended starting doses in renally impaired patients; dosing may need further adjustment due to wide inter subject pK variability. METOJECT SUBCUTANEOUS is contraindicated in patients with severe renal impairment (see CONTRAINDICATIONS).

</tbody>
</table>

**Pediatrics (<18 years of age):** Safety and effectiveness in pediatric patients have not been established (see WARNINGS AND PRECAUTIONS: Special Populations, Pediatrics).

**Geriatrics (≥65 years of age):** Due to diminished hepatic and renal function as well as decreased folate stores in elderly population, relatively low doses (especially in rheumatoid arthritis and
psoriasis indications) should be considered and these patients should be closely monitored for early
signs of toxicity. See Table 5 for reduced doses in patients with renal impairment.

**Missed Dose**
If a scheduled dose is missed, contact your doctor for instructions.

**OVERDOSAGE**

Discontinue or reduce dosage at the first sign of ulceration or bleeding, diarrhea, or marked
depression of the hematopoietic system. Leucovorin is indicated to diminish the toxicity and
counteract the effect of inadvertently administered overdosages of methotrexate. Leucovorin
administration should begin as promptly as possible. As the time interval between methotrexate
administration and leucovorin initiation increases, the effectiveness of leucovorin in
countering toxicity decreases. Monitoring of the serum methotrexate concentration is essential
in determining the optimal dose and duration of treatment with leucovorin.

In cases of massive overdosage, hydration and urinary alkalinization may be necessary to prevent
the precipitation of methotrexate and/or its metabolites in the renal tubules. Generally, neither
standard hemodialysis nor peritoneal dialysis has been shown to improve methotrexate
elimination. However, effective clearance of methotrexate has been reported with acute,
intermittent hemodialysis using a high-flux dialyzer.

There are published case reports of intravenous carboxypeptidase G2 treatment to hasten clearance
of Methotrexate in cases of overdoses.

For management of a suspected drug overdose, contact your regional Poison Control Centre.

**ACTION AND CLINICAL PHARMACOLOGY**

**Mechanism of Action**
Methotrexate is a folate antagonist.

Methotrexate has immunosuppressive activity. This may be a result of inhibition of lymphocyte
multiplication. The mechanisms of action in the management of rheumatoid arthritis of the drug is
not known, although suggested mechanisms have included immunosuppressive and/or anti-
inflammatory effects.

In psoriasis, the rate of production of epithelial cells in the skin is greatly increased over normal
skin. This differential in proliferation rates is the basis for the use of methotrexate to control the
psoriatic process.

**Pharmacokinetics**
Absorption:
Methotrexate is generally completely absorbed following parenteral administration, and after intramuscular injection peak serum concentrations occur in 30 to 60 minutes.

Distribution:
Methotrexate in serum is approximately 50% protein bound. After intravenous administration, the initial volume of distribution is approximately 0.18 L/kg (18% of body weight) and steady-state volume of distribution is approximately 0.4 to 0.8 L/kg (40% to 80% of body weight). Methotrexate does not penetrate the blood-cerebrospinal fluid barrier in therapeutic amounts when given orally or parenterally.

Metabolism:
After absorption, Methotrexate undergoes hepatic and intracellular metabolism to polyglutamated forms which can be converted back to methotrexate by hydrolase enzymes. These polyglutamates act as inhibitors of dihydrofolate reductase and thymidylate syntheses. Small amounts of methotrexate polyglutamates may remain in tissues for extended periods. The retention and prolonged drug action of these active metabolites vary among different cells, tissues and tumours. A small amount of metabolism to 7-hydroxymethotrexate may occur at doses commonly prescribed. The aqueous solubility of 7-hydroxymethotrexate is 3 to 5 fold lower than the parent compound. Methotrexate is partially metabolized by intestinal flora after oral administration.

Excretion:
Renal excretion is the primary route of elimination and is dependent upon dosage and route of administration. Excretion of single daily doses occurs through the kidneys in amounts from 80% to 90% within 24 hours. Repeated daily doses result in more sustained serum levels and some retention of methotrexate over each 24-hour period, which may result in accumulation of the drug within the tissues. The liver cells appear to retain certain amounts of the drug for prolonged periods even after a single therapeutic dose. Methotrexate is retained in the presence of impaired renal function and may increase rapidly in the serum and in the tissue cells under such conditions. Methotrexate does not penetrate the blood-cerebrospinal fluid barrier in therapeutic amounts when given orally or parenterally.

The terminal half-life reported for methotrexate is approximately 3 to 10 hours for patients receiving treatment for psoriasis, or rheumatoid arthritis.

Methotrexate clearance rates vary widely and are generally decreased at higher doses.

Special Populations and Conditions

Nursing Women:
Methotrexate has been detected in human breast milk and is contraindicated during breast feeding. The highest breast milk to plasma concentration ratio reached was 0.08: 1.

Renal Impairment: Since the renal excretion of methotrexate is the primary route of elimination with 80% to 90% of the single daily doses of methotrexate excreted through the kidneys within 24 hours, methotrexate is retained in the presence of impaired renal function and may increase rapidly in the serum and in the tissue cells under such conditions, thus in patients with renal impairment
the health care provider may need to adjust the dose to prevent accumulation of drug.

**Hepatic Impairment:** Hepatic excretion of methotrexate is a minor route of elimination. However, the liver cells appear to retain certain amounts of the drug for prolonged periods even after a single therapeutic dose. Special caution is indicated in the presence of pre-existing liver damage or impaired hepatic function.

**STORAGE AND STABILITY**

Keep in a safe place out of the reach of children.

Store METOJECT SUBCUTANEOUS between 15-25°C. Store it away from heat and direct light. Avoid freezing. Any unused solution should be discarded.

**SPECIAL HANDLING INSTRUCTIONS**

**General:**
Individuals who have contact with this drug or work in areas where these drugs are used, may be exposed to these agents in air or through direct contact with contaminated objects. Potential health effects may be reduced by adherence to institutional procedures, published guidelines and local regulations for preparation, administration, transportation and disposal of hazardous drugs.

**Safe Handling and Disposal:**
Good medical practice will minimize exposure of persons involved with frequent handling of this drug as outlined below:

**Handling:**
Methotrexate has no vesicant properties and does not show acute toxicity on topical contact with the skin or mucous membranes. However, persons involved with handling this drug should avoid contact with skin and inhalation of airborne particles.

**DOSAGE FORMS, COMPOSITION AND PACKAGING**

METOJECT SUBCUTANEOUS (methotrexate injection) 50 mg/mL (as methotrexate sodium) is available in single-use pre-filled syringes. Non-medicinal ingredients include sodium chloride, sodium hydroxide and water for injection.

METOJECT SUBCUTANEOUS is available as follows;
* 1 mL syringe with 0.15 mL solution for injection, equivalent to 7.5 mg methotrexate
* 1 mL syringe with 0.2 mL solution for injection, equivalent to 10 mg methotrexate
* 1 mL syringe with 0.25 mL solution for injection, equivalent to 12.5 mg methotrexate
* 1 mL syringe with 0.3 mL solution for injection, equivalent to 15 mg methotrexate
* 1 mL syringe with 0.35 mL solution for injection, equivalent to 17.5 mg methotrexate
* 1 mL syringe with 0.4 mL solution for injection, equivalent to 20 mg methotrexate
* 1 mL syringe with 0.45 mL solution for injection, equivalent to 22.5 mg methotrexate
* 1 mL syringe with 0.5 mL solution for injection, equivalent to 25 mg methotrexate

All syringes are available in cartons of 1, 4, or 12 single-use pre-filled syringes with embedded injection needles (type 27 G, ½ inch, made from stainless steel).
PART II: SCIENTIFIC INFORMATION

PHARMACEUTICAL INFORMATION

Drug Substance

**Proper name:** Methotrexate

**Chemical name:** Methotrexate

N-[4-[[2,4-diamino-6-pteridinyl)methylamino]benzoyl]-L-glutamic acid

Amethopterin

4-Amino-4-deoxy-10-methylpteroyl-L-glutamic Acid

4-Amino-10-methylfolic acid

**Molecular formula and molecular mass:** $C_{20}H_{22}N_8O_5$ (454.45 g/mol)

**Structural formula:**

![Structural formula of Methotrexate](image)

**Physicochemical properties:**

- **Physical Form:** A yellow to orange-brown crystalline powder. Contains not more than 12% water. Methotrexate is a mixture of 4-amino-10-methylfolic acid and closely related compounds and is equivalent to not less than 94.0% of $C_{20}H_{22}N_8O_5$, calculated on the anhydrous basis. The parenteral solution is prepared with the sodium salt, but potency is always expressed on the basis of the acid.

- **Solubility:** Practically insoluble in water, chloroform, ether and alcohol, but freely soluble in dilute solutions of mineral acids, alkali hydroxides and carbonates.

- **Note:** methotrexate sodium is formed in situ during drug product manufacturing.
DETAILED PHARMACOLOGY

Human Pharmacokinetics

Absorption
Methotrexate is generally completely absorbed following parenteral administration, and after intramuscular injection peak serum concentrations occur in 30 to 60 minutes.

Distribution
After intravenous administration, the initial volume of distribution is approximately 0.18 L/kg (18% of body weight) and steady-state volume of distribution is approximately 0.4 to 0.8 L/kg (40% to 80% of body weight). Methotrexate competes with reduced folates for active transport across cell membranes by means of a single carrier-mediated active transport process. At serum concentrations greater than 100 micromolar, passive diffusion becomes a major pathway by which effective intracellular concentrations can be achieved. Methotrexate in serum is approximately 50% protein bound. Laboratory studies demonstrate that it may be displaced from plasma albumin by various compounds including sulfonamides, salicylates, tetracyclines, chloramphenicol, and phenytoin.

Methotrexate does not penetrate the blood-cerebrospinal fluid barrier in therapeutic amounts when given parenterally.

In dogs, synovial fluid concentrations after oral dosing were higher in inflamed than uninflamed joints. Although salicylates did not interfere with this penetration, prior prednisone treatment reduced penetration into inflamed joints to the level of normal joints.

Metabolism
After absorption, methotrexate undergoes hepatic and intracellular metabolism to polyglutamated forms, which can be converted back to methotrexate by hydrolase enzymes. These polyglutamates act as inhibitors of dihydrofolate reductase and thymidylate syntheses. Small amounts of methotrexate polyglutamates may remain in tissues for extended periods. The retention and prolonged drug action of these active metabolites vary among different cells, and tissues. A small amount of metabolism to 7-hydroxy methotrexate may occur at doses commonly prescribed. The aqueous solubility of 7-hydroxy methotrexate is 3 to 5 fold lower than the parent compound. Methotrexate is partially metabolized by intestinal flora after oral administration.

Half-Life
The terminal half-life reported for Methotrexate is approximately three to ten hours for patients receiving treatment for psoriasis, or rheumatoid arthritis.

Excretion
Renal excretion is the primary route of elimination and is dependent upon dosage and route of administration. With IV administration, 80% to 90% of the administered dose is excreted unchanged in the urine within 24 hours. There is limited biliary excretion amounting to 10% or less of the administered dose. Enterohepatic recirculation of methotrexate has been proposed.
Renal excretion occurs by glomerular filtration and active tubular secretion. Non-linear elimination due to saturation of renal tubular reabsorption has been observed in psoriatic patients at doses between 7.5 and 30 mg. Impaired renal function, as well as concurrent use of drugs such as weak organic acids that also undergo tubular secretion, can markedly increase methotrexate serum levels. Excellent correlation has been reported between methotrexate clearance and endogenous creatinine clearance.

Methotrexate clearance rates vary widely and are generally decreased at higher doses. Delayed drug clearance has been identified as one of the major factors responsible for methotrexate toxicity. It has been postulated that the toxicity of methotrexate for normal tissues is more dependent upon the duration of exposure to the drug rather than the peak level achieved. When a patient has delayed drug elimination due to compromised renal function, a third space effusion, or other causes, methotrexate serum concentrations may remain elevated for prolonged periods.

The potential for toxicity from delayed excretion is reduced by the administration of leucovorin calcium during the final phase of methotrexate plasma elimination.

**TOXICOLOGY**

The acute toxicity (LD₅₀) of methotrexate in mice ranges from 65 to 70 mg/kg intravenously and 45 to 90 mg/kg intraperitoneally.

The acute oral toxicity (LD₅₀) in rats is 317 mg/kg; subcutaneously, it is 58 mg/kg and intraperitoneally it ranges from 80 to 464 mg/kg.

In a 22 month carcinogenicity study in rats that received methotrexate at doses of 0.1, 0.2 and 0.4 mg/kg/day, 5 days/week every other week, little or no effect of the drug was observed. It has been concluded that methotrexate is apparently remarkably free from toxic effects when otherwise lethal doses are administered utilizing an intermittent dosage schedule providing for a recovery period of 9 days. For example, daily oral doses of 0.4 mg/kg are lethal doses both in dogs and rats when administered for up to two weeks; when 0.5 mg/kg and 0.4 mg/kg doses, respectively, were administered daily five times a week every other week for three months to dogs and ten months to rats, they were found to be essentially without toxicity.

Methotrexate is often used clinically in doses that are nearly toxic and may cause severe depression of all blood cellular elements. Constant supervision is recommended and signs of gastrointestinal ulceration and bleeding, including bleeding from the mouth, bone marrow depression, primarily of the white cell series and alopecia are indications of toxicity. In general, toxicity is in direct proportion to dose and exposure time to methotrexate.

Toxicity of methotrexate to the bone marrow and gastrointestinal epithelium is not so much dependent on dosage as on the duration of exposure of these organs to the drug and its extracellular (plasma) concentration. For bone marrow and gastrointestinal tract, the critical time factor has been defined as about 42 hours and the critical plasma concentration as 2x10⁻⁸M. Both factors must be exceeded for toxicity to occur to these organs.
Doses of methotrexate resulting in plasma levels in excess of $2 \times 10^{-8}$ M circulating for greater than 42 hours will be toxic to both the bone marrow and gastrointestinal epithelium. This toxicity can be minimized by the appropriate administration of Leucovorin Calcium.

Methotrexate may be hepatotoxic, particularly at high dosage and with prolonged therapy. Liver atrophy, necrosis, cirrhosis, fatty changes and periportal fibrosis have been reported.

PART III: CONSUMER INFORMATION

PRIMEJOCT® SUBCUTANEOUS methotrexate injection

This leaflet is part III of a three-part "Product Monograph" published when METOJECT SUBCUTANEOUS was approved for sale in Canada and is designed specifically for Consumers. This leaflet is a summary and will not tell you everything about METOJECT SUBCUTANEOUS. Contact your doctor or pharmacist if you have any questions about the drug.

ABOUT THIS MEDICATION

What the medication is used for:
METOJECT SUBCUTANEOUS belongs to a group of medicines known as immunosuppressants. It is used to treat psoriasis and rheumatoid arthritis.

What it does:
In rheumatoid arthritis, methotrexate acts on the inflammatory cells that cause joint swelling. METOJECT SUBCUTANEOUS therapy is used to control psoriasis and rheumatoid arthritis but it will not cure them. Some normal cells in the body may be affected as well.

Ask your doctor if you have any questions about why it has been prescribed for you.

When it should not be used:
Do not take METOJECT SUBCUTANEOUS if you:
- Are allergic to methotrexate or any component of the drug (see What the nonmedicinal ingredients are). Some of the symptoms of an allergic reaction to methotrexate may include rash, itching or hives on the skin, swelling of the face, lips, tongue or other parts of the body, shortness of breath, wheezing or troubled breathing.
- Have any blood disorders including:
  - bleeding from a lack of blood cells called platelets.
  - low iron in the blood (anemia).
- Have an immune system disorder such as AIDS (autoimmune deficiency syndrome) or HIV, the virus which causes AIDS.
- Have an infection.
- Have severe kidney problems.
- Have severe liver disorder.
- Suffer from alcoholism or alcoholic liver disease.
- Have a stomach ulcer.
- Have inflammation and bleeding from the rectum, with abdominal pain and diarrhea (ulcerative colitis).
- Are pregnant (see section “Pregnancy and Fertility”).
- Are breastfeeding (see section “Pregnancy and Fertility”).
- You are on dialysis
- You are going to receive a general anesthetic called nitrous oxide. It is also known as laughing gas.

What the medicinal ingredient is:
Methotrexate (meth-o-TREX-ate).

What the nonmedicinal ingredients are:
Sodium chloride, sodium hydroxide and water for injection.

What dosage forms it comes in:
METOJECT SUBCUTANEOUS (methotrexate injection) 50 mg/mL (as methotrexate sodium) is available in single-use-filled syringes.

METOJECT SUBCUTANEOUS is available as follows;
- 1 mL syringe with 0.15 mL solution for injection, equivalent to 7.5 mg methotrexate
- 1 mL syringe with 0.2 mL solution for injection, equivalent to 10 mg methotrexate
- 1 mL syringe with 0.25 mL solution for injection, equivalent to 12.5 mg methotrexate
- 1 mL syringe with 0.3 mL solution for injection, equivalent to 15 mg methotrexate
- 1 mL syringe with 0.35 mL solution for injection, equivalent to 17.5 mg methotrexate
- 1 mL syringe with 0.4 mL solution for injection, equivalent to 20 mg methotrexate
- 1 mL syringe with 0.45 mL solution for injection, equivalent to 22.5 mg methotrexate
- 1 mL syringe with 0.5 mL solution for injection, equivalent to 25 mg methotrexate

WARNINGS AND PRECAUTIONS

Serious Warnings and Precautions
* You should not plan to have children while taking METOJECT SUBCUTANEOUS or for a while after stopping treatment. (Talk to your doctor for further details.)
* Use a reliable method of birth control to prevent pregnancy.

Before Using This Medicine
Before you begin treatment with METOJECT SUBCUTANEOUS, you should talk to your doctor about the good this medicine will do as well as the risks of using it.

In deciding to use a medicine, the risks of taking the medicine must be weighed against the good it will do. This is a decision you and your doctor will make. For METOJECT SUBCUTANEOUS, the following should be considered:
Allergies:
- Tell your doctor if you have ever had any unusual or allergic reaction to methotrexate.

Pregnancy and Fertility:
- Tell your doctor if you are pregnant or if you plan to have children. Do not use Metoject during pregnancy or if you are trying to become pregnant. Methotrexate can cause birth defects, harm the unborn child or cause miscarriage. It is associated with malformations of the skull, face, heart and blood vessels, brain and limbs. Therefore, it is very important that methotrexate is not given to pregnant patients or patients planning to become pregnant. In women of child-bearing age, any possibility of pregnancy must be excluded with appropriate measures, e.g. pregnancy test before starting treatment.

- You must avoid becoming pregnant whilst taking methotrexate from 6 months to one year after treatment is stopped by using reliable contraception throughout this time. If you do become pregnant during treatment or suspect you might be pregnant, speak to your doctor as soon as possible. You should be offered advice regarding the risk of harmful effects on the child through treatment. Tell your doctor right away if you think you have become pregnant while taking METOJECT SUBCUTANEOUS.

- If you wish to become pregnant you should consult your doctor, who may refer you for specialist advice before the planned start of treatment.

- Methotrexate temporarily affects sperm and egg production. Methotrexate can cause miscarriage and severe birth defects. You must avoid becoming pregnant when using methotrexate and for six months to one year after treatment has stopped.

Male Fertility
- Methotrexate may be genotoxic. This means that the medicine may cause genetic mutation. Methotrexate can affect sperm production with the potential to cause birth defects. Therefore, you should avoid fathering a child or to donate semen whilst taking methotrexate and from 6 months to one year after treatment is stopped.

Breast-feeding:
- Stop breast feeding prior to and during treatment with METOJECT SUBCUTANEOUS.

Children:
- METOJECT SUBCUTANEOUS is not for use in children.

Older adults:
- Side effects may be more likely to occur in the elderly, who are usually more sensitive to the effects of METOJECT SUBCUTANEOUS.

Other medicines:
- When you are taking METOJECT SUBCUTANEOUS, it is important that your doctor know if you are taking any other prescription or non-prescription medicine. They should also be told if you have ever been treated with x-rays or cancer medicines or if you drink alcohol.

Other medical problems:
The presence of other medical problems may affect the use of METOJECT SUBCUTANEOUS. Tell your doctor if you have any other medical problems, especially:
- Alcohol abuse (or history of)
- Chickenpox (including recent exposure) or Herpes zoster (shingles)
- Colitis
- Disease of the immune system
- Gout (or history of)
- Kidney stones (or history of)
- Infection
- Intestine blockage
- Kidney disease
- If you are dehydrated or have a lot of vomiting, diarrhea, or sweating.
- Liver disease, including hepatitis B and C infection
- Mouth sores or inflammation
- Stomach ulcer

Precautions while using this medicine
It is very important that your doctor check your progress at regular visits to make sure that this medicine is working properly and to check for unwanted effects.

Do not drink alcohol while taking METOJECT SUBCUTANEOUS. Alcohol can increase the chance of liver problems.

Some patients who take METOJECT SUBCUTANEOUS may become more sensitive to sunlight than they are normally. Avoid too much sun exposure and do not use a sunlamp until you see how you react to the sun, especially if you tend to burn easily.

You should not receive certain vaccinations while taking METOJECT SUBCUTANEOUS. Discuss this with your doctor. Avoid anyone who has had oral polio vaccine for at least six weeks. Do not get close to them or stay in the same room for very long. If this is not possible, wear a mask over your nose and mouth.
Some side effects such as dizziness and fatigue may affect the ability to drive or operate machinery. These activities should be avoided. If you have any concerns, please consult your doctor.

METOJECT SUBCUTANEOUS can lower the number of white blood cells in your blood temporarily, increasing the chance of getting an infection. It can also lower the number of platelets, which are necessary for proper blood clotting. If this happens, there are certain precautions you can take, especially when your blood count is low to reduce the risk of infection or bleeding:

- If you can, avoid people with infections. Check with your doctor immediately if you think you are getting an infection or if you get a fever or chills, cough or hoarseness, lower back or side pain, or painful or difficult urination.
- Check with your doctor immediately if you notice any unusual bleeding or bruising; black, tarry stools; blood in urine or stools; or pinpoint red spots on your skin.
- Be careful when using a regular toothbrush, dental floss, or toothpick. Check with your doctor before having any dental work done.
- Do not touch your eyes or the inside of your nose unless you have just washed your hands.
- Be careful not to cut yourself when you are using sharp objects such as scissors or a razor.
- Avoid contact sports or other situations where bruising or injury could occur.

Methotrexate can cause sudden bleeding in the lungs. This is called **Pulmonary alveolar haemorrhage**. If you suddenly spit or cough up blood you must go to the hospital right away. You will need emergency care. This occurs in patients with some existing health problems. Some examples are rheumatic disorder (such as pain in your joints) or vasculitis such as swelling in an artery or vein.

**INTERACTIONS WITH THIS MEDICATION**

<table>
<thead>
<tr>
<th>Do not take METOJECT SUBCUTANEOUS if you are going to receive a general anesthetic called nitrous oxide. It is also known as laughing gas. When used together, they can cause:</th>
</tr>
</thead>
<tbody>
<tr>

</table>

Tell your doctor and pharmacist what prescription and non-prescription medications you are taking. METOJECT SUBCUTANEOUS may interact with other medicines such as:

- acetyl salicylic acid (ASA) and other pain killers or nonsteroidal anti-inflammatory drugs (NSAIDs)
- some antibiotics (including penicillins tetracycline, and sulfonamides, and medicines to prevent malaria – pyrimethamine)
- some epilepsy treatments
- some cancer treatments
- some vaccines
- some medicines used to lower your cholesterol (including cholestyramine)
- azathioprine (used to prevent transplant organ rejection)
- cytarabine (used to treat leukemia)
- leflunomide (used to treat rheumatoid arthritis)
- mercaptopurine (used to treat leukemia)
- nitrous oxide anaesthesia
- probenicid (used to treat gout)
- retinoid medicines (used to treat acne)
- sulfonylureas (used to treat diabetes)
- sulfasalazine (used to treat Crohn's disease, rheumatoid arthritis and ulcerative colitis)
- theophylline (used to treat asthma)
- the vitamin folic acid
- phenytoins
- proton pump inhibitors (PPI). They are drugs used to treat acid related stomach problems. Some PPIs are omeprazole, esomeprazole, and pantoprazole.
- amiodarone (used to treat irregular heart beat)
- triamterene (diuretic or “water pill”)
- PUVA therapy (used to treat skin conditions)

It is very important to tell your doctor about all other medicines you are taking including those you buy without a prescription. You may need to receive different amounts of your medicine or you may need to receive different medicines.

Tell any doctor that is treating you that you are taking METOJECT SUBCUTANEOUS.

If you have not told your doctor or pharmacist about any of the above, tell them before you are given METOJECT SUBCUTANEOUS.

**PROPER USE OF THIS MEDICATION**

Take METOJECT SUBCUTANEOUS only as directed by your doctor. Do not take more or less of it, and do not take it more often than your doctor ordered. The exact amount of medicine you need has been carefully worked out. Taking
too much may increase the chance of side effects, while taking too little may not improve your condition.

The dose is given once a week only. It is given by your health care professional.

Each METOJECT SUBCUTANEOUS syringe can be used only one time.

While you are using METOJECT SUBCUTANEOUS, your doctor may want you to drink extra fluids so that you will pass more urine. This will help the drug to pass from the body, and will prevent kidney problems and keep your kidneys working well.

METOJECT SUBCUTANEOUS commonly causes nausea and vomiting. Even if you begin to feel ill, do not stop using this medicine without first checking with your doctor. Ask your doctor for ways to lessen these effects.

Always keep the syringe out of the reach of children.

Usual adult dose:
The dose of METOJECT SUBCUTANEOUS will be different for different patients. The dose that is used may depend on a number of things, including what the medicine is being used for, the patient's size, and whether or not other medicines are also being taken. If you have any questions about the proper dose of METOJECT SUBCUTANEOUS, ask your doctor.

The doctor may decrease your dose if you have problems with your kidneys.

Overdose

In case of a drug overdose, contact a healthcare professional, hospital emergency department or regional poison control centre, even if there are no symptoms. Always take the labeled medicine with you, even if it is empty.

Missed Dose

• If you missed a scheduled dose, or have any doubts or concerns about missed doses, contact your doctor for instruction

SIDE EFFECTS AND WHAT TO DO ABOUT THEM

Along with their needed effects, medicines like METOJECT SUBCUTANEOUS can sometimes cause unwanted effects. Also, because of the way these medicines act on the body, there is a chance that they might cause other unwanted effects that may not occur until months or years after the medicine is used. These delayed effects may include certain types of cancer, such as leukemia. Discuss these possible effects with your doctor.

The most common side effects include:

• Upset stomach, stomach pain, vomiting, nausea, loss of appetite, dizziness, chills and fever, diarrhea or sores on lips or mouth.
• A fall in the number of white blood cells. This may reduce your resistance to infection and increase your chances of cold sores, blood poisoning or swelling of blood vessels.

Less common side effects are:

• Headaches, hair loss, mood changes, confusion, ringing in the ears, sore eyes, skin rashes.
• A fall in the number of other blood cells. This may increase your chances of bruising, bleeding or tiredness.
• Damage to the lungs.
• Harm to the unborn baby.

Rarely and generally at higher doses for treatment of other diseases, METOJECT SUBCUTANEOUS can cause other side effects including:

• Liver damage, kidney damage, pain or difficulty urinating, lower back or side pain, blood in urine or stools, dark urine
• Fits, blurred vision, short term blindness
• Drowsiness, weakness
• Hoarseness
• Bloody vomit, black tarry stools or pin-point red spots on the skin
• Reddening or whitening of the skin, acne, boils, itching yellow skin or eyes
• Impotence or loss of interest in sex, decreased fertility, abortion
• Diabetes, thinning of the bones, painful muscles and joints

More rarely, it can cause:

• Skin rash and other skin disorders.
• Cancer of lymph glands, sudden death.
• Severe allergic reactions.
• Lymphoproliferative disorders (excessive growth of white blood cells).

Although the frequency is unknown, it can cause:

• Bone damage in the jaw (secondary to excessive growth of white blood cells).
• Bleeding from the lungs.
Methotrexate can cause abnormal test results. Your doctor will decide when to perform tests and will interpret the results. This includes blood and urine tests to check how your kidneys are working.

### SERIOUS SIDE EFFECTS, HOW OFTEN THEY HAPPEN AND WHAT TO DO ABOUT THEM

<table>
<thead>
<tr>
<th>Symptom / effect</th>
<th>Talk with your doctor or pharmacist</th>
<th>Stop taking drug and seek immediate medical help</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Only if severe</td>
<td>In all cases</td>
</tr>

- Suddenly spit or cough up blood

### HOW TO STORE IT

- Store METOJECT SUBCUTANEOUS between 15-25°C. Any unused solution should be discarded.
- Keep out of the reach and sight of children.
- Store it at room temperature and away from heat and direct light. Avoid freezing.
- Do not keep outdated medicine or medicine no longer needed. Be sure that any discarded medicine is out of the reach and sight of children.

*This is not a complete list of side effects. For any unexpected effects while taking METOJECT SUBCUTANEOUS, contact your doctor or pharmacist.*
Reporting Side Effects
You can report any suspected side effects associated with the use of health products to Health Canada by:

- Visiting the Web page on Adverse Reaction Reporting ([http://www.hc-sc.gc.ca/dhpmps/medeff/report-declaration/index-eng.php](http://www.hc-sc.gc.ca/dhpmps/medeff/report-declaration/index-eng.php)) for information on how to report online, by mail or by fax; or
- Calling toll-free at 1-866-234-2345.

*NOTE: Contact your health professional if you need information about how to manage your side effects. The Canada Vigilance Program does not provide medical advice.*
